

UNITED STATES DISTRICT COURT  
EASTERN DISTRICT OF NEW YORK

ADRIAN RIVERA and ADRIAN  
RIVERA MAYNEZ ENTERPRISES,

Plaintiffs,

v.

DIGITAL DISTRIBUTORS, INC.,

Defendant.

No. 1:21-cv-2342

**COMPLAINT FOR PATENT  
INFRINGEMENT OF UNITED  
STATES PATENT NO. 8,511,225 AND  
VIOLATION OF NEW YORK  
GENERAL BUSINESS LAW §§ 349  
AND 350**

Plaintiffs Adrian Rivera and Adrian Rivera Maynez Enterprises (collectively “ARM”), by and through their attorneys, for their Complaint against Defendant Digital Distributors, Inc. (“Defendant”), hereby allege as follows:

**NATURE OF THE ACTION**

1. This is an action arising under the patent laws of the United States, 35 U.S.C. § 271, *et seq.* and for deceptive business practices and false advertising arising under the laws of the state of New York.

2. Defendant has violated the Patent Act by, at minimum, using, selling, and/or offering to sell within the United States products that infringe one or more claims of United States Patent No. 8,511,225 (“the ’225 patent”). Such products include the CJC-4021W Courant Automatic Citrus Juicer (“Courant Juicer”).

3. Defendant has also engaged in deceptive business practices and has made materially false and misleading advertising claims in violation of New York General Business Law §§ 349 and 350, including by distributing a product that

falsely includes third-party safety verification seals on the face of the infringing Courant Juicer and/or on associated packaging and promotional materials.

4. ARM now seeks monetary damages resulting from Defendant's actions. ARM also seeks preliminary and permanent injunctive relief to prevent Defendant from continuing to infringe the '225 patent and violate New York state law.

### **THE PARTIES**

5. Plaintiff Adrian Rivera is a California resident. Mr. Rivera is owner, founder, and president of Adrian Rivera Maynez Enterprises.

6. Plaintiff Adrian Rivera Maynez Enterprises is a corporation located at 16141 Heron Avenue, La Mirada, California 90638.

7. On information and belief, Defendant Digital Distributors, Inc. is a company organized under the laws of the State of New York and is located at 149 47th Street, Brooklyn, New York 11232.

8. On information and belief, Defendant distributes the Courant Juicer on behalf of Luzerne Trading Company, the manufacturer of the Courant Juicer.

### **JURISDICTION AND VENUE**

9. This Court has subject matter jurisdiction of this case pursuant to 28 U.S.C. §§ 1331, 1338(a), and 1338(b), which provide for federal question jurisdiction for patent infringement actions. This Court has supplemental jurisdiction over the related state law claims pursuant to 28 U.S.C. §§ 1338(b) and/or 1337(a).

10. Defendant is subject to personal jurisdiction in this Court because Defendant maintains its principal place of business in this district and has

purposefully availed itself of the privilege of transacting extensive business in the State of New York.

11. Venue in this judicial district is proper under 28 U.S.C. §§ 1391(b), 1391(c), and/or 1400(b). Defendant maintains a regular and established place of business within this District, and, as set forth below, has committed acts of infringement in this District.

### **FACTUAL BACKGROUND**

12. ARM is a well-known player in the single-serve coffee brewing and accessories market. It prides itself on developing high-quality products that are both convenient and safe. ARM has enjoyed commercial success with many of its products and is a recognized name in the coffee product industry.

13. In recent years, ARM has sought to expand its product lines to include other beverage markets such as juice. In July of 2019, after investing years of research and significant expense to develop a high-caliber product worthy of the ARM brand, ARM launched the first of its citrus juicers, the Vinci™ Hands-Free Citrus Juicer.

14. The Vinci™ Hands-Free Citrus Juicer is quick and easy to use. Users need only slice the citrus fruit in half, place the fruit on the reamer, close the lid, and press a single button to produce fresh-squeezed juice in a matter of seconds. Unlike other juicers, Vinci™ users do not need to hold the fruit in place, manually squeeze the juice, or engage with multiple automated settings or buttons. The Vinci™ is capable of juicing citrus fruits of many sizes, ranging from small limes to grapefruits having a four-and-a-half-inch diameter.

15. The Vinci™ automatically senses the thickness of the fruit and avoids juicing into the rind (which can cause bitterness in the juice). Users can enjoy fresh juice with or without pulp, depending on whether they opt to use the removable strainer. The Vinci™ is also easy to disassemble and clean.

16. As part of its efforts to ensure the utmost quality and safety of its products, ARM undertook to obtain certification from a globally recognized third-party certification body, Intertek. Intertek offers an “ETL” safety certification for electronic products, which indicates the product meets North American safety standards. According to Intertek’s website, the certification is recognized by international officials, retail buyers, and even consumers, who have begun to recognize the ETL symbol as synonymous with safety. Indeed, many retailers require products to comply with ETL standards and have certification prior to agreeing to resell them to consumers.

17. Intertek requires companies to undergo an extensive vetting process before it will certify any product and include it in the Intertek database. This process involves, at minimum, an initial application, testing of the product (including testing of any components supplied by third party manufacturers), factory inspection, and production line testing, among many other steps.<sup>1</sup> This extensive vetting process can pose a barrier for companies that seek entry into the market.

---

<sup>1</sup> See [https://www.intertek.com/uploadedfiles/intertek/divisions/commercial\\_and\\_electrical/media/pdf/certifications\\_and\\_marks/etl\\_end\\_to\\_end\\_process.pdf](https://www.intertek.com/uploadedfiles/intertek/divisions/commercial_and_electrical/media/pdf/certifications_and_marks/etl_end_to_end_process.pdf) (last accessed 3/23/2021).

18. Intertek actively maintains the certification, including by making unannounced visits for site inspection. Following certification, Intertek permits the company to place a seal on the product to indicate it has been certified by Intertek and complies with North American safety standards.

19. ARM underwent this process and is now authorized to include the ETL mark for its Vinci™ juicer. ARM includes the ETL mark on the Vinci's™ packaging and promotional materials, including on the underside of its box.

20. Unsurprisingly, ARM's product has been successful in the market and has received rave reviews. The Vinci™ is available for purchase at major retailers such as Target, Walmart, and Amazon, as well as on [www.vincihousewares.com](http://www.vincihousewares.com).

21. Mr. Rivera and ARM invested time and expense in developing intellectual property relating to the Vinci™, including the '225 patent.

22. After ARM launched the Vinci™, Defendant began distributing a starkly similar knock-off product. As shown in the image below, the infringing Courant Juicer (left) distributed by Defendant looks nearly identical to the Vinci™ (right).

23. The Courant Juicer similarly indicates on the box it is easy to use, convenient, “hands-free,” and capable of juicing small and large citruses.

24. On information and belief, Defendant distributes the infringing Courant Juicer to various major retailers, including at least Amazon.com.

25. Defendant has not only infringed Mr. Rivera’s intellectual property without authorization but has also positioned the Courant Juicer product to compete with ARM’s product.

26. For example, the Courant Juicer Defendant distributes includes an ETL mark on its face and on associated packaging and/or marketing materials (such as its specification sheet, available online). Upon information and belief, unlike ARM, however, the Courant Juicer does not actually have a valid certification from Intertek. Defendant nevertheless continues to distribute a product that includes the mark without authorization from Intertek to falsely indicate the product has been certified by Intertek and complies with North American safety standards, as shown below.

27. Similarly, Underwriters Laboratories, Inc. is another globally recognized third-party certifier of electronic goods. This third party offers the “UL” certification to indicate compliance with its safety standards, which are intended to protect against electrical fires and/or electrocution. UL standards have been adopted by state and federal agencies for a variety of products.

28. The Courant Juicer also includes a UL mark on its packaging and/or associated promotional materials, as shown below.

29. On information and belief, Underwriters Laboratories, Inc. has not certified the Courant Juicer through its certification process.

30. Defendant offers the Courant Juicer at a lower price point than ARM’s Vinci™ juicer and has distributed the Courant Juicer to some of the same vendors selling the Vinci™, such as Amazon.com. Given the stark similarities in design, appearance, and marketing, Defendant’s false representations that the product is ETL and UL certified further misleads consumers into believing they will receive a product of comparable safety at a lower price point.

31. Retailers and consumers rely on these well-known marks as an accurate indicator of safety and are harmed by Defendant's distribution of products that are deceptively labeled and/or advertised.

32. ARM has been damaged by Defendant's actions, including by experiencing diverted or diminished sales following Defendant's distribution of the knock-off Courant Juicer.

## COUNT I

### **Infringement of the '225 patent Under 35 U.S.C. § 271**

33. ARM incorporates the foregoing paragraphs 1-32 by reference as though set forth fully herein.

34. The United States Patent and Trademark Office issued the '225 patent, entitled Automated Juice Extractor, on August 20, 2013 to Adrian Rivera. A true and correct copy of the '225 patent is attached hereto as Exhibit A.

35. Adrian Rivera has owned and continues to own the '225 patent at all times.

36. Defendant has used, sold, or offered to sell within the United States the Courant Juicer. Defendant has thereby directly infringed at least claims 1, 3, 4, 6, and 9 of the '225 patent under 35 U.S.C. § 271. An exemplary comparison of the Courant Juicer with independent claim 1 of the '225 patent is attached hereto as Exhibit B.

37. On April 13, 2021, counsel for ARM sent a letter (by email and FedEx) requesting Defendant cease and desist from further infringement of the '225 patent.

ARM received confirmation the letter was successfully delivered. In the letter, ARM indicated it would be filing suit if Defendant failed to respond by April 23, 2021 with an agreement to cease and desist its infringement. Further, as an enclosure to the cease-and-desist letter, ARM included a copy of Exhibit B demonstrating infringement of at least independent claim 1 of the '225 patent by the Courant Juicer. Defendant did not respond. Accordingly, at least as of April 13, 2021, Defendant became aware of the '225 patent and that the sale/distribution of the Courant Juicer constitutes infringement. Defendant's ongoing infringement and refusal to cease further sale and distribution constitutes willful infringement.

38. ARM has suffered and will continue to suffer irreparable harm through Defendant's infringement of the '225 patent should Defendant be permitted to continue to do so. ARM therefore seeks a preliminary and permanent injunction to stop Defendant's infringing behavior.

39. ARM is also entitled to recover monetary damages from Defendant as a result of its infringement of the '225 patent, including lost profits and/or reasonable royalties.

## COUNT II

### **Violation of New York General Business Law § 349**

40. ARM incorporates the foregoing paragraphs 1-39 by reference as though set forth fully herein.

41. Defendant, in connection with distributing the Courant Juicer within New York and in interstate commerce, has engaged in deceptive acts or practices,

including by selling, distributing, and/or advertising a product that falsely indicates it complies with globally recognized safety standards and has received third-party certification.

42. Defendant's act of distributing a falsely labeled product is consumer oriented. Consumers rely on representations made on the product and associated packaging/promotional materials, particularly if they relate to the product's safety. The false and misleading statements on the Courant Juicer deceived or tended to deceive a substantial segment of consumers and/or retail purchasers who saw the ETL and UL marks on the product and associated materials and are aware of its significance with respect to safety. The presence of these marks is material to consumers' and/or retailers' decisions to purchase the Courant Juicer instead of competing products, such as the Vinci™.

43. ARM has been harmed as a result of Defendant's actions, including by suffering a diversion of sales of its ETL-compliant products.

44. Unless Defendant's activities cease, ARM will continue to be damaged by Defendant's distribution and sale of the Courant Juicer and consumers' reliance on the false statements thereon.

45. ARM is entitled to a preliminary and permanent injunction to prevent Defendant from continuing to harm ARM and consumers, along with treble damages for a willful violation, and/or attorneys' fees as permitted by New York General Business Law § 349.

//

### COUNT III

#### Violation of New York General Business Law § 350

46. ARM incorporates the foregoing paragraphs 1-45 by reference as though set forth fully herein.

47. Defendant, in connection with selling the Courant Juicer within New York and in interstate commerce, has engaged in advertising the Courant Juicer to retailers and consumers. Such advertisements, including representations made on the specification sheet and on packaging associated with the product, falsely and misleadingly indicate the Courant Juicer complies with third-party safety certifications.

48. Consumers and retailers rely on such representations in making their purchasing decisions. Defendant's act of distributing a falsely advertised product is therefore consumer oriented.

49. ARM has been harmed as a result of Defendant's actions, including by suffering a diversion of sales of its ETL-compliant products.

50. Unless Defendant's activities cease, ARM will continue to be damaged by Defendant's distribution and sale of the Courant Juicer and consumers' reliance on the false statements thereon.

51. ARM is entitled to a preliminary and permanent injunction to prevent Defendant from continuing to harm ARM and consumers, along with all damages permitted under New York General Business Law § 350.

## PRAYER FOR RELIEF

**WHEREFORE**, ARM respectfully requests the following relief:

- A. Judgment that the '225 patent has been and continues to be willfully infringed by Defendant;
- B. Judgment that Defendant has engaged in deceptive acts or practices in violation of New York General Business Law § 349;
- C. Judgment that Defendant has made one or more false and misleading advertising statements in violation of New York General Business Law § 350;
- D. All damages sustained as a result of Defendant's infringement of the '225 patent, including a reasonable royalty, lost profits, price erosion, and/or any and all other forms of damages to which ARM is entitled, as well as treble damages for Defendant's willful infringement;
- E. Damages sustained as a result of Defendant's violation of the New York General Business Law §§ 349 and 350, including actual damages, enhanced damages, and attorney's fees;
- F. Pre-judgment interest and post-judgment interest at the maximum rate allowed by law;
- G. Preliminary and permanent injunction enjoining Defendant, its officers, agents, servants, employees, sub-distributors, resellers, service partners, suppliers, and all other persons acting in concert or participation with it from further infringement of the '225 patent;
- H. Preliminary and permanent injunction enjoining Defendant, its officers, agents, servants, employees, distributors, resellers, service partners,

suppliers, and all other persons acting in concert or participation with it from further selling or distributing a product that falsely contains the ETL and UL marks without certification;

- I. A finding that this case is exceptional and granting an award of attorneys' fees pursuant to 35 U.S.C. § 285, or as otherwise permitted by law;
- J. All costs of suit; and
- K. Such other and further relief as the Court may deem just and proper.

## US 8,511,225 B2

**1****AUTOMATED JUICE EXTRACTOR**

The present application is a Continuation In Part of U.S. patent application Ser. No. 12/206,964 filed Sep. 9, 2008 and U.S. patent application Ser. No. 12/406,314 filed Mar. 18, 2009, which applications are incorporated in their entirety herein by reference.

## BACKGROUND OF THE INVENTION

The present invention relates to juice extractors and in particular the electric juice extractors.

Juice extractors are commonly used to extract juice from, for example, oranges. Known manual juice extracts comprise a bowl with a raised conical ridged center, called a juicing cone. A user cuts a fruit in half, and pushes and rotates the exposed cut side down over the juicing cone. The juice is thereby released into the bowl.

Manual juice extractors have been largely replaced by electric juicers. Various electric juicers exist, including centrifugal juicers which include blades and spins to separate the juice from pulp, masticating which grinds and then squeezes the juice from the pulp, and simple citrus juicers which resemble a manual juicer but include an electric motor to rotate the juicing cone.

While the known juicers are often satisfactory, users still desire a simple automatic juicer which is not as rough on the fruit as the centrifugal or masticating juicers, but does not require the users to manually push the fruit on the electrically turned juicing cone. U.S. patent application Ser. No. 12/206,964 filed Sep. 9, 2008 by the present applicant discloses an automated juicer providing many of the benefits desired, however, further development resulted in an alternative embodiment which simplifies manufacturing.

## BRIEF SUMMARY OF THE INVENTION

The present invention addresses the above and other needs by providing an automatic juicer which turns and pushes an upward facing juicing cone into a fruit for releasing and collecting juice. The juicer includes a base containing a motor, gear and shaft assembly which rises as a unit lifting and turning the juicing cone. A fixed guide extends upward from the base and inner and outer shafts reside inside the fixed guide and are driven by the motor and gear assembly to rotate and advance the juicing cone into the fruit. The outer shaft includes external threads which engage internal threads of a fixed collet at the base of the fixed guide to translate rotation into vertical translation. The outer shaft includes threads to vertically advance and retreat the outer and inner shafts when the outer shaft turns. The inner shaft rises with the outer shaft and lifts and rotates the juicing cone thereby releasing juice from the fruit. A strainer and a bowl below the juicing cone filter and catch the juice. The strainer advances vertically with juicing cone but does not rotate so that knife edges on the bottom of the juicing cone scrape pulp from the strainer to prevent clogging. The bowl is fixed to the base.

In accordance with one aspect of the invention, there is provided an automatic juicer. The juicer includes a base, a lid attached to the base and openable to allow fruit to be placed in the juicer; a center column assembly attached to the base and including a collet fixed to the base and having internal threads, and a motor, gear and shaft mechanism inside the juicer and advancing and retreating vertically as a unit. The motor, gear and shaft mechanism includes a motor in the base, a gear set in the base and engaging the motor, and a shaft assembly extending above the base. The shaft assembly

**2**

includes an outer shaft threadably engaging the collet for vertically advancing and retreating when turned by the motor through the gear set, and an inner shaft rotating inside the outer shaft and advancing and retreating vertically with the outer shaft. An upward facing juicing cone is attached to the inner shaft and rotates and advances vertically with the inner shaft into a fruit. A bowl resides under the juicing cone and is attached to the base. The juicing cone thereby rotates and pushes into a fruit for releasing juice from the fruit to be caught in the bowl.

In accordance with another aspect of the invention, there is provided an automatic juicer. The juicer includes a base containing a motor and a gear set engaging the motor. A lid is attached to the base and is openable to allow fruit to be placed in the juicer. A center column assembly is attached to the base and includes a collet fixed to the base. An outer shaft threadably engages the collet and vertically advances and retreats when turned by the motor through the gear set. An inner shaft rotates with the outer shaft and advances and retreats vertically with the outer shaft when turned by the motor. A bowl is attached to the base and an upward facing juicing cone is attached to the inner shaft and rotates and advances vertically with the inner shaft, rotating and pushing into a fruit for releasing juice from the fruit to be caught in the bowl. A non-rotating strainer advances and retreats vertically with the juicing cone and knife edges on a bottom surface of the juicing cone clear pulp blocking the strainer.

## BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING

The above and other aspects, features and advantages of the present invention will be more apparent from the following more particular description thereof, presented in conjunction with the following drawings wherein:

FIG. 1 is a juicer according to the present invention.

FIG. 2 is a cross-sectional view of the juicer according to the present invention with a juicing cone in an up position and the lid closed.

FIG. 3 is a cross-sectional view of the juicer according to the present invention with the juicing cone in a down position and the lid closed.

FIG. 4 is a cross-sectional view of the juicer according to the present invention with the juicing cone in a down position and the lid open.

FIG. 5A is a cross-sectional view of the lid of the juicer.

FIG. 5B is a cross-sectional view of a fruit holder, according to the present invention, of the juicer.

FIG. 5C is a cross-sectional view of the juicing cone, according to the present invention, of the juicer.

FIG. 5D is a cross-sectional view of a strainer, according to the present invention, of the juicer.

FIG. 5E is a cross-sectional view of a bowl, according to the present invention, of the juicer.

FIG. 6 is an exploded view of a center column assembly, according to the present invention, of the juicer.

FIG. 7 shows a vertical stop according to the present invention.

FIG. 8 shows a strainer key and key way.

FIG. 9A is a side view of an outer tube (or column), according to the present invention, of the center column of the juicer.

FIG. 9B is a bottom view of an outer tube, according to the present invention, of the center column of the juicer.

FIG. 9C is a side view of an outer tube, according to the present invention, of the center column assembly of the juicer.

FIG. 9D is a cross-sectional view of the outer tube taken along line 9D-9D of FIG. 9A.

## US 8,511,225 B2

3

FIG. 9E is a cross-sectional view of the outer tube taken along line 9E-9E of FIG. 9C.

FIG. 10A is a side view of a drive shaft, according to the present invention, of the center column of the juicer.

FIG. 10B is a bottom view of the drive shaft of the center column assembly of the juicer.

FIG. 10C is a top view of the drive shaft of the center column assembly of the juicer.

FIG. 11A is a side view of a nut, according to the present invention, of the center column assembly of the juicer.

FIG. 11B is a top view of the nut of the center column assembly of the juicer.

FIG. 12A is a side view of a driven shaft, according to the present invention, of the center column assembly of the juicer.

FIG. 12B is a bottom view of the driven shaft of the center column assembly of the juicer.

FIG. 12C is a top view of the driven shaft of the center column assembly of the juicer.

FIG. 13A is a side view of a lift tube, according to the present invention, of the center column assembly of the juicer.

FIG. 13B is a bottom view of the lift tube of the center column assembly of the juicer.

FIG. 13C is a top view of the lift tube of the center column assembly of the juicer.

## DETAILED DESCRIPTION OF THE INVENTION

The following description is of the best mode presently contemplated for carrying out the invention. This description is not to be taken in a limiting sense, but is made merely for the purpose of describing one or more preferred embodiments of the invention. The scope of the invention should be determined with reference to the claims.

A juicer 10 according to the present invention is shown in FIG. 1, a cross-sectional view of the juicer 10 with a juicing cone in an up position and a lid 12 closed is shown in FIG. 2, a cross-sectional view of the juicer 10 with a juicing cone in a down position and the lid 12 closed is shown in FIG. 3, and a cross-sectional view of the juicer 10 with a juicing cone in a down position and the lid 12 open is shown in FIG. 4. A hinge 16 connects the lid 12 to the base 14, and a latch 18 holds the lids closed during operation of the juicer 10. The fruit holder 24 includes anti-slip elements on the inside fruit surface to prevent the fruit from rotating inside the fruit holder 24 during operation of the juicer. The anti-slip elements may be spikes, ridges or the like, for example ridges 24'.

The juicer 10 includes a base 14 housing a motor 20 and a gearing assembly 22 (see FIGS. 17A and 17B for details). The motor 20 may be manually controlled by a user to operate in a first direction to raise the juicing cone against fruit for about 5 seconds and then manually controlled to lower the juicing cone, or may be automated to raise the juicing cone against fruit for about 5 seconds and then automatically reverse. The motor 20 and the gearing assembly 22 may alternatively be controlled by measuring the vertical force of the juicing cone against the fruit, and the motor direction reversed when the force reaches a predetermined level.

The juicer 10 includes a fruit holder 24, the juicing cone 26, a strainer 28, and a bowl 29. The fruit holder 24 is fixed inside the lid 12 and opens with the lid 12. The juicing cone 26 includes ridges 25 (see FIG. 5C) and rises into the fruit and rotates. The ridges 25 cut into the pulp of the fruit to release fruit juice and the rising juicing cone 26 compresses the pulp to further release the juice. The strainer 28 resides under the juicing 26 cone and rises with the juicing cone 26 but does not rotate. The bowl 29 is fixed to the base 14 and does not rise or rotate, and catches the juice released from the fruit.

A cross-sectional view of the lid 12 of the juicer 10 is shown in FIG. 5A, a cross-sectional view of the fruit holder 24, according to the present invention, of the juicer 10 is shown in FIG. 5B, a cross-sectional view of the juicing cone 26, according to the present invention, of the juicer 10 is shown in FIG. 5C, a cross-sectional view of a strainer 28, according to the present invention, of the juicer 10 is shown in FIG. 5D, and a cross-sectional view of a bowl 29, according to the present invention, of the juicer 10 is shown in FIG. 5E. The upward facing face of the juicing cone 26 includes ridges 25 for cutting into the pulp of the fruit and a lower end of the juicing cone 26 includes blades (or scrapers) 27 which scrape against a top surface of the strainer 28 to prevent pulp from blocking the strainer 28 during use. The fruit holder 24 includes a seat 21 for limiting upward movement of the juicing cone 26, and the juicing cone 26 includes a stop 23 for cooperation with the seat 21.

An exploded view of a center column assembly 30 according to the present invention of the juicer 10 is shown in FIG. 6. The center column assembly 30 includes a rotating and

## US 8,511,225 B2

5

vertically translating lift tube 32, a stationary (non-rotating and non-translating) outer tube 34 attached to the base 14 (see FIG. 1), a spring 36, a driven shaft 38, a nut 40, and a drive shaft 42. The lift tube 32 lifts and rotates the juicing cone 26. The spring 36 resides inside the outer tube 34 and provides downward force on the driven shaft 38 and/or the nut 40 to bias the center column assembly 30 towards a down position (see FIGS. 2-4). The driven shaft 38 resides inside the drive shaft 42 and is keyed to rotate with the drive shaft 42 but free to vertically translate. The nut 40 is threaded into the exterior of the drive shaft 42 and includes at least one outside notch 44 (see FIG. 11B) to engage a vertical rail 39 (see FIG. 9D) in the outer tube 34 to prevent the nut 40 from rotating with the drive shaft 42. A smooth portion 42' at the top of the drive shaft 42 allows the drive shaft 42 to rotate freely from the nut 40 at maximum extension.

A vertical stop according to the present invention is shown in FIG. 8. The juicing cone 26 includes a stop 23 at the peak of the cone, and the fruit holder 24 includes a seat 21 above the stop 23. The seat 21 limits the vertical movement of the juicing cone 26 to establish a minimum gap G between the ridges 25 and the interior of the fruit holder 24 to prevent or reduce the ridges 25 cutting into the fruit rind.

A strainer key 37 and key way 31 are shown in FIG. 8. The key 37 resides on an edge of the strainer and engages the key way 31 in the lid 12 and/or bowl 29 to prevent rotation of the strainer 28 so that the blades 27 on the bottom of the juicing cone 26 can scrape pulp from the inside of the strainer 28, which pulp might otherwise block the strainer 28.

A side view of the outer tube (or column) 34 of the center column assembly 30 of the juicer 10 is shown in FIG. 9A, a bottom view of the outer tube 34 is shown in FIG. 9B, a side view of the outer tube 34 is shown in FIG. 9C, a cross-sectional view of the outer tube 42 taken along line 9D-9D of FIG. 9A is shown in FIG. 9D, and a cross-sectional view of the outer tube 34 taken along line 9E-9E of FIG. 9C is shown in FIG. 9E. The outer tube 34 has a cylindrical exterior and cylindrical interior with an outer tube flange 35 at the base for attaching to the juicer base 14. The outer tube 34 is fixed and neither rotates nor translates. An interior vertical rail 39 runs the length of the interior and cooperates with one of the notches 44 (see FIG. 11B) of the nut 40 to prevent rotation of the nut. The outer tube 34 includes a ceiling 37 for cooperation with the spring 36. While a preferred outer tube 34 has a cylindrical interior and exterior, a juicer according to the present invention with an outer column which is not cylindrical is intended to come within the scope of the present invention.

A side view of a drive shaft 42, according to the present invention, of the center column assembly 30 of the juicer 10 is shown in FIG. 10A, a bottom view of the drive shaft 42 is shown in FIG. 10B, and a top view of the drive shaft 42 is shown in FIG. 10C. The drive shaft 42 is connected to the motor 20 through the gearing assembly 22 (see FIG. 2) and is rotated by the gearing assembly 22 but does not translate. The drive shaft 42 includes threads 45 on a cylindrical exterior for cooperation with a threaded interior 47 (see FIG. 11B) of the nut 40. Because the outer tube 34 prevents rotation of the nut 40, rotation of the drive shaft 42 causes the nut 40 to translate vertically. The drive shaft 42 further includes a lengthwise inner passage 41 and key ways 43 running vertically lengthwise into the inner passage 41. The inner passage 41 is preferably cylindrical to reduce manufacturing costs, but may have other cross-sections.

A side view of the nut 40, according to the present invention, of the center column assembly 30 of the juicer 10 is shown in FIG. 11A, and a top view of the nut 40 is shown in

6

FIG. 11B. The nut 40 includes a threaded interior 47 for cooperation with threads 45 on the drive shaft 42 (see FIG. 10A) and external notches 44 and external lands 46 on the exterior of the nut. The lands 46 center the nut 40 in the inner passage 41 of the drive shaft 42 and the notches 44 prevent the nut 40 from rotating inside the outer column 34. Only one notch 44 is required and in another embodiment, the nut may include a projecting key for cooperation with a key way inside the outer column 34.

10 A side view of the driven shaft 38, according to the present invention, of the center column assembly 30 of the juicer 10 is shown in FIG. 12A, a bottom view of the driven shaft 38 is shown in FIG. 12B, and a top view of the driven shaft 38 is shown in FIG. 12C. The driven shaft includes two keys 48 for cooperation with the key ways 43 in the drive shaft 42, causing the driven shaft 38 to rotate with the drive shaft 42 but allowing the driven shaft 38 to translate vertically with respect to the drive shaft 42. The driven shaft 38 further includes a cylindrical body 50 and a hexagonal nose 54 at an upper end for engaging the lift tube 32.

15 A side view of a lift tube 32, according to the present invention, of the center column assembly 30 of the juicer 10 is shown in FIG. 13A, a bottom view of the lift tube 32 is shown in FIG. 13B, a top view of the lift tube 32 is shown in FIG. 13C, and a cross-sectional view of the lift tube 32 taken along line 14-14 of FIG. 13A is shown in FIG. 14. The lift tube 32 has a hexagonal exterior 6, a round base flange 58, and a hexagonal recess 56 in the base for cooperation with the nose 54 of the driven shaft 38 (see FIG. 12A). The lift tube is lifted and rotated by the driven shaft 38 and lifts and rotates the juicing cone 26 (see FIG. 5C).

20 A second embodiment of a center column assembly 70, according to the present invention, of the juicer 10, is shown in FIG. 15. The center column assembly 70 includes an inner tube 74, a second outer tube 34', and a hexagonal driven shaft 72. The second outer tube 34' is similar to the outer tube 34, but does not include the ceiling 37, allowing the inner tube 74 to be inserted into the top of the outer tube 34' and have an outer diameter sliding into the interior of the outer tube 34'. The exterior of the inner tube 74 includes a notch 76 running the length of the inner tube 74 to engage the vertical rail 39 of the outer tube 34' to allow the inner tube 74 to translate vertically within the outer tube 34', but to cause the inner tube 74 to rotate with the outer tube 34'. The hexagonal driven shaft 45 72 engages the juicing cone 26 to lift and rotate the juicing cone 26 (see FIG. 5C). The center column assembly 70 is otherwise similar to the center column assembly 30.

25 A second fruit holder 24' with an adjustable seat 80 is shown in FIG. 16. The adjustable seat 80 preferably includes threads which cooperate with the fruit holder 24' to allow adjustment of the gap G between the juicing cone 26 and the fruit holder 24'.

The gearing assembly 22 (see FIG. 2) according to the present invention is shown in a high speed position in FIG. 55 17A and in a high torque position in FIG. 17B. The gearing assembly 22 includes a motor 82, switch 84, first gears 94 and 96, second gears 90 and 92, third gears 86 and 88, and a spring 98. The gears 94 and 96 are always engaged. In the relaxed (or UP) position, the spring 98 pushed the gears 90 and 86 upwards, and the gear 90 engages the gear 92 to provide high speed. In the compressed (or DOWN) position, the spring 98 is compressed allowing the gears 90 and 86 to move downward, and the gear 86 engages the gear 88 to provide high torque. The spring 98 further provides a relief from exerting too great a downward force on the gearing assembly 22 or too much upward force on the juicing cone 26. The springs 98 and 36 (see FIG. 6) combine to limit the force exerted on the fruit

## US 8,511,225 B2

7

to preferably between one pound and 50 pounds, and more preferably limit the force exerted on the fruit to between ten pounds and 25 and most preferably limit the force exerted on the fruit to approximately 18 pounds.

A side view of a second embodiment of a motor, gear, and shaft mechanism 102 in a down position is shown in FIG. 18A and a side view of the second embodiment of a motor, gear, and shaft mechanism in the "UP" position is shown in FIG. 18B. The mechanism 102 includes the motor 82 mounted below a mounting plate 106, a gear set 104 mounted above the mounting plate 106, an outer shaft 116 connected to the gears 104 resides above the mounting plate 106, and an inner shaft 114 is also connected to the gears 104 resides above the mounting plate 106. The mounting plate 106 slides vertically with the outer shaft 116 on vertical posts 108 which are connected between a base flange 112 and an upper base plate 100.

The outer shaft 116 has male threads 118 on a lower portion, and the threads 118 engage female threads (not shown) inside a fixed collet 110 attached to the plate 100. The motor 82 turns the inside and outside shafts 114 and 116 thought the gear set 104, generally at different speeds, and the rotation of the outside shaft 116 causes the mechanism 102 to raise and lower. The male threads 118 on the outside shaft 116 do not extend to the base of the outside shaft 116, and as a result, the threads 118 may disengage from the collet 110 allowing the outer shaft 116 to continue to turn after reaching a highest position in the juicer.

A detailed side view of the motor, gear, and shaft mechanism 102 is shown in FIG. 19A and a detailed top view of the motor, gear, and shaft mechanism 102 is shown in FIG. 19B. The inside shaft 114 is free to rotate inside the outside shaft 116 independently of the outside shaft 116 and preferably turns at a higher speed than the outer shaft 116.

A more detailed view of the gear set 104 is shown in FIG. 20. A small first gear 104a is connected to the motor 82. A large gear 104b engages the gear 104a and rotates at a lower speed than the motor 82. A second small gear 104c is connected to the gear 104b and rotates at the same speed as the gear 104b. A second large gear 104d engages the gear 104c and rotates at a lower speed than the gear 104 and at a much lower rate than the motor 82. Both the small gear 104g and the medium size gear 104e, are attached to the gear 104d and turn at the same speed as the gear 104d. The large gear 104f engages the medium gear 104 and rotates somewhat slower than the gear 104e. The large gears 104h engages the small gear 104g and rotates slower than the gear 104g.

The outer shaft 116 is connected to the gear 104h and rotates at the same speed as the gear 104h and the inner shaft 114 is connected to the gear 104f and rotates at the same speed as the gear 104f. As a result both the outer shaft 116 and the inner shaft 114 turn much slower than the motor 81, and the inner shaft 114 preferably turns faster than the outer shaft 116. In a simpler embodiment with fewer gears, the inner shaft 114 turns at the same speed as the outer shaft 116.

A side view of the outer shaft 116 and the inner shaft 114 with a spring 118 providing vertical support to the inner shaft 114, thus limiting the force exerted by the juicing cone 26 (see FIGS. 22A and 22B) on the fruit, is shown in FIG. 21. The spring 117 preferably limits the force exerted on the fruit to preferably between one pound and 20 pounds, and more preferably limits the force exerted on the fruit to between ten pounds and 20 and most preferably limits the force exerted on the fruit to approximately 18 pounds. An inner shaft flange 114a maybe provided to contact a switch 115 to reverse the direction of the motor 82 when a desired vertical force has

8

been achieved compressing the spring 117. The switch 115 is electrically connected to electronics 122 in the base of the juicer (see FIG. 22A).

The mechanism 102 is shown in the juicer 10 in FIG. 22A in the down position and in FIG. 22B in the up position. Other than the mechanism 102, the second embodiment of the juicer 10 is similar to the embodiment described in FIGS. 1-17B. The juicer 10 in FIG. 22 shows the mechanism 102 in the up position with the juicing cone 26 lifted to push the juicing cone 26 into the fruit. The strainer 28 is preferably carried vertically by the outer shaft 114 and raises and lowers with the juicing cone 26 and may rotate with the juicing cone 26, but preferably is keyed to the juicer housing and does not rotate, thereby being cleared by the bottom surface of the rotating juicing cone.

A switch 120 is electrically connected to electronics 122 in the base of the juicer. The switch 120 starts the operation of the juicer and the direction of the motor 82 is initially to advance the juicing cone 26 into the fruit. The motor 82 direction may be reversed after a period of time to vertically retreat the juicing cone from the fruit using a timer in the electronic 122, or after a preset resistance to advancing the juicing cone into the fruit is experienced by compression of the spring 118 actuating the switch 115 (see FIG. 21).

An alternative gear set 104a for a second embodiment of the juicer according to the present invention is shown in FIG. 23, a side view of the outer shaft 116 and the inner shaft 114 the second embodiment of the gear set 104a according to the present invention is shown in FIG. 24, and a side view of the outer shaft 116 and the inner shaft 114 of the second embodiment of the gear set in the juicer is shown in FIG. 25. The gears 104e and 104f(see FIG. 20) which rotate the inner shaft 114 independently of the outer shaft 116 are deleted and the inner shaft 114 includes a pin 130 engaging a slot 132 in the base of the outer shaft 116 to rotate the inner shaft 116 at the same rate as the outer shaft 116. A spring 118 resides over a post 114a at the base of the inner shaft 114 and vertically supports the inner shaft 114 to limit the force exerted by the inner shaft on the juicing cone 26 to not overly injure the fruit during use.

A cross-sectional view of the collet 134 of the second embodiment of the juicer according to the present invention is shown in FIG. 26. The collet 134 has internal threads 135 for engaging external threads 117 on the outer shaft 116 for advancing and retreating the shafts 116 and 114.

A spring loaded collet 134a a third embodiment in the juicer according to the present invention is shown in FIG. 27. The inner shaft 114 is fixed to the outer shaft 116 to rotate and advance and retreat vertically with the outer shaft 116 and may be a single piece with the outer shaft 116. The collet 134a is supported by a spring 136 so that if resistance is met at the peak vertical advance of the shaft 116, the collet can retreat downward to not overly injure the fruit during use.

A spring loaded fruit holder 24 in the juicer according to the present invention is shown in FIG. 28. The spring 138 allows the fruit holder 24 to rise if resistance is met at the peak vertical advance of the shaft 116 to not overly injure the fruit during use without springs 118 and 136 of FIGS. 24 and 27.

The embodiments of FIGS. 18A through 28 may exercise a vertical overrun wherein outside threads on the outer shaft 116 advance the outer shaft upwards and disengage from inner threads of the collet 134, providing a dwell time at the peak vertical travel of the shafts until the motor 82 reverses and returned the shafts to a lower position. While the shafts are at the peak vertical travel, a "clicking" may be heard once per revolution of the shafts as the teeth pass each other and the vertical shaft 116 falls slightly inside the collet 134. While

## US 8,511,225 B2

9

such “clicking” presents no functional issues, it may annoy a user. An O-ring 115 on the shaft 116 in FIG. 24 may provided to damping the vertical failing of the outer shaft 116 to prevent or reduce the “clicking”. The O-Ring 116 preferably reside in a groove in the exterior of the shaft 116. Alternatively, the motor 82 may be reversed before the teeth disengage to prevent the “clicking”.

The direction of the motor is initially to advance the juicing cone into the fruit, and either after a period of time, or when a preset level of resistance is met by the vertically advancing juicing cone, the direction of the motor reverses to vertically retreat the juicing cone from the fruit.

While the invention herein disclosed has been described by means of specific embodiments and applications thereof, numerous modifications and variations could be made thereto by those skilled in the art without departing from the scope of the invention set forth in the claims.

I claim:

1. An automatic juicer comprising:  
a lid openable to allow fruit to be placed in the juicer;  
a base containing a motor and a gearset;  
a mounting plate residing in the base and configured to move vertically within the base;  
a collet fixed to the base;  
a shaft assembly connected to the motor through the gearset, all parts of the shaft assembly rotating at the same angular rate and the shaft assembly threadably engaging the collet to vertically advance and retreat the entire shaft assembly when turned by the motor, the mounting plate, the motor, and the gearset coupled to the shaft assembly to move vertically with the shaft assembly the shaft assembly including an outer shaft and an inner shaft; the inner shaft being rotationally fixed to rotate with the outer shaft and advances vertically with the outer shaft;  
a bowl attached to the base; and  
a juicing cone above the bowl and fixedly attached to the shaft assembly and rotating and advancing vertically with the shaft assembly, the juicing cone for rotating and pushing into a fruit for releasing juice from the fruit to be caught in the bowl, the vertical advance of the juicing cone limited to reduce damage to fruit in the juicer.

2. The juicer of claim 1, further including a strainer between the bowl and the juicing cone, wherein the strainer rotates with the juicing cone.

3. The juicer of claim 1, further including a strainer between the bowl and the juicing cone, wherein:  
the strainer advances vertically with the juicing cone;  
the strainer does not rotate; and  
the juicing cone includes knife edges on a bottom surface for clearing pulp blocking the strainer.

4. The juicer of claim 1, wherein the direction of the motor is initially to advance the juicing cone into the fruit, and after a period of time the direction of the motor reverses to vertically retreat the juicing cone from the fruit.

5. The juicer of claim 1, wherein the direction of the motor is initially to advance the juicing cone into the fruit, and after a preset resistance to advancing the juicing cone into the fruit is experienced, the direction of the motor reverses to vertically retreat the juicing cone from the fruit.

6. The juicer of claim 1, wherein:  
the juicing cone is supported by the inner shaft; and  
the inner shaft is vertically supported by a spring to limit the force of the juicing cone against the fruit.

7. The juicer of claim 1, wherein the collet is vertically supported by a spring to limit the force of the juicing cone against the fruit.

10

8. The juicer of claim 1, wherein a fruit holder resides above the juicing cone for holding the fruit and a spring above the fruit holder allows the fruit holder to rise to limit the force of the juicing cone against the fruit.

9. The juicer of claim 1, wherein outside threads on the shaft assembly advance the shaft assembly upwards and disengage from inner threads of the collet, providing a dwell time at the peak vertical travel of the shaft assembly until the motor reverses and returns the shaft assembly to a lower position.

10. The juicer of claim 1, wherein:  
the collet translates vertically and is biased upward by a spring residing under the collet, the spring supported by a fixed base plate; and  
when the juicing cone encounters resistance to further upward translation, the collet is pushed downward compressing the spring.

11. The juicer of claim 1, wherein:  
the shaft assembly comprises a threaded outer shaft cooperating with the collet and an inner shaft rotationally fixed to the outer shaft;  
a pin passes through the inner shaft proximal to a base of the inner shaft;  
the pin passes through vertical slots on a base of the outer shaft, restraining the inner shaft to rotate with the outer shaft while allowing the inner shaft to translate vertically within the outer shaft; and  
a spring resides under the inner shaft vertically supporting the inner shaft; and  
when the juicing cone encounters resistance to further upward translation, the inner shaft is pushed downward compressing the spring.

12. An automatic juicer comprising:  
a lid openable to allow fruit to be placed in the juicer;  
a base containing a motor and a gearset;  
a mounting plate residing in the base and configured to move vertically within the base;  
a collet rotationally fixed to the base, the collet translating vertically and biased upward by a spring residing between the collet and a fixed base plate under the collet;  
a shaft assembly connected to the motor through the gearset and threadably engaging the collet to vertically advance and retreat the entire shaft assembly when turned by the motor, the mounting plate, the motor, and the gearset coupled to the shaft assembly to move vertically with the shaft assembly the shaft assembly including an outer shaft and an inner shaft; the inner shaft being rotationally fixed to rotate with the outer shaft and advances vertically with the outer shaft;  
a bowl attached to the base; and  
a juicing cone above the bowl and fixedly attached to the shaft assembly and rotating and advancing vertically with the shaft assembly, for rotating and pushing into a fruit for releasing juice from the fruit to be caught in the bowl, and when the juicing cone encounters resistance to further upward translation, the collet is pushed downward compressing the spring, the vertical advance of the juicing cone limited to reduce damage to fruit in the juicer.

13. An automatic juicer comprising:  
a lid openable to allow fruit to be placed in the juicer;  
a base containing a motor and a gearset;  
a mounting plate residing in the base and configured to move vertically within the base;  
a collet fixed to the base;  
a shaft assembly connected to the motor through the gearset and threadably engaging the collet to vertically

US 8,511,225 B2

**11**

advance and retreat the entire shaft assembly when turned by the motor, the shaft assembly comprising:  
an outer shaft threadably engaging the collet to vertically advance and retreat when turned by the motor;  
an inner shaft rotationally fixed to the outer shaft and advancing and retreating vertically with the outer shaft;  
a pin passing through the inner shaft proximal to a base of the inner shaft, the pin passing through slots on a base of the outer shaft, restraining the inner shaft to rotate with the outer shaft while allowing the inner shaft to translate vertically within the outer shaft;  
a spring residing under the inner shaft vertically supporting the inner shaft; and  
the mounting plate, the motor, and the gearset coupled to the shaft assembly to move vertically with the shaft assembly;  
a bowl attached to the base; and  
a juicing cone above the bowl and attached to the inner shaft and rotating and advancing vertically with the

5

10

15

**12**

inner shaft for rotating and pushing the juicing cone into a fruit for releasing juice from the fruit to be caught in the bowl, and  
when the juicing cone encounters resistance to further vertical advancing, the inner shaft is biased against further vertical advancing compressing the spring.  
**14.** The juicer of claim **6**, further including:  
a vertical slot in a base of the outer shaft;  
a pin passing through the inner shaft proximal to a base of the inner shaft, the pin passing through the vertical slot in the base of the outer shaft, restraining the inner shaft to rotate with the outer shaft while allowing the inner shaft to translate vertically within the outer shaft; and  
a spring residing under the inner shaft vertically supporting the inner shaft.  
**15.** The juicer of claim **14**, wherein:  
the shaft assembly is rotated by a gear attached proximal to the base of the outer shaft; and  
the vertical slot extends from below the gear to the base of the outer shaft.

# EXHIBIT B

## Exhibit B

Patent No. 8,511,225

This claim chart is provided based on publicly available materials and/or Plaintiffs' investigation to date, prior to any fact or expert discovery, or claim construction. Plaintiffs reserve the right to supplement and/or amend the allegations herein for any reason and reserve the right to assert additional independent and dependent claims.

Exemplary claim 1	Infringing feature of Courant juicer
An automatic juicer comprising:  a lid openable to allow fruit to be placed in the juicer;	<p>The Courant juicer is an automatic juicer.</p> <p>"Auto Press: Automatically Juices The Fruits On Its Own!"</p> <p><i>See e.g.,</i> Courant Juicer Box.</p>
	<p>The Courant juicer has a lid openable to allow fruit to be placed in the juicer.</p>  <p><i>See e.g.,</i> Courant Juicer Product Spec Sheet.</p>
a base containing a motor and a gearset;	The base of the Courant Juicer contains a motor and gearset.

	
	<p><i>See e.g., Courant Juicer Product.</i></p>
a mounting plate residing in the base and configured to move vertically within the base;	The Courant has a mounting plate (red arrow) that resides in the base and is configured to move vertically within the base. 
a collet fixed to the base;	The Courant juicer has a collet fixed to the base.

	 <p><i>See e.g., Courant Juicer Product.</i></p>
<p>a shaft assembly connected to the motor through the gearset, all parts of the shaft assembly rotating at the same angular rate and the shaft assembly threadably engaging the collet to vertically advance and retreat the entire shaft assembly when turned by the motor, the mounting plate, the motor, and the gearset coupled to the shaft assembly to move vertically with the shaft assembly the shaft assembly including an outer shaft and an inner shaft; the inner shaft being rotationally fixed to rotate with the outer shaft and advances vertically with the outer shaft;</p>	<p>The Courant juicer has a shaft assembly that is connected to the motor through the gearset.</p>  <p><i>See e.g., Courant Juicer Product.</i></p> <p>All parts of the assembly rotate at the same angular rate.</p> <p>The shaft assembly (blue) threadably engages the collet (red) to vertically advance and retreat the entire shaft assembly when turned by the motor.</p>

The mounting plate, the motor, and the gearset are coupled to the shaft assembly to move vertically with the shaft assembly.

*See e.g., Courant Juicer Product.*

The shaft assembly includes an outer shaft (blue) and an inner shaft (red), and the inner shaft is rotationally fixed to rotate with the outer shaft and advances vertically with the outer shaft.

*See e.g., Courant Juicer Product.*

a bowl attached to the base; and

The Courant juicer has a bowl attached to the base.

*See e.g., Courant Juicer Product.*

a juicing cone above the bowl and fixedly attached to the shaft assembly and rotating and advancing vertically with the shaft assembly, the juicing cone for rotating and pushing into a fruit for releasing juice from the fruit to be caught in the bowl, the vertical advance of the juicing cone limited to reduce damage to fruit in the juicer.

The Courant juicer has a juicing cone above the bowl that is fixedly attached to the shaft assembly.

The juicing cone rotates and advances vertically with the shaft assembly. The juicing cone rotates and pushes into the fruit to release juice, which is caught in the bowl.

The vertical advance of the juicing cone is limited, including by the lid of the juicer, to reduce damage to the fruit.
